

To save our country, we must get rid of the voting machines...

- They all run on secret, proprietary software that change vote counts without leaving a trace.
- They can be easily hacked to change vote counts, either at the machine or from a remote location.
- They are expensive to buy, maintain and store and they frequently breakdown during elections to make waiting time longer so voters will leave without voting.
- They are made by a small group of private corporations that essentially wrote the “Help America Vote Act” of 2002 which handed over 3.9 billion dollars to the states for their counties to buy pre-rigged, highly intimidating machines.

...and demand paper ballots that are hand-counted.

- They are *always* in public view and citizens count them. The process is 100% transparent.
- Yes, people will still stuff ballot boxes and steal old people’s votes, but *not* at the scale of millions of votes like the machines can do.
- They are less expensive to make and require no costly maintenance or special storage facilities.
- And best of all, they are corporate-free.

How to make this happen:

- Get serious and get involved NOW. Don’t dilly-dally.
- Join a group already working to make this happen or start your own. It’s important to work with people face to face.
- Learn all the arguments and excuses our election officials and politicians throw out about how we can’t go back to the “old way”. Then learn how to counter them with conviction.

Join VoteRescue.
